b. Which variables from mpg dataset are categorical?

From the data mpg, the categorical data are the following:

1. Transmission(trans)
2. Model
3. Fuel type(fl)
4. Drive Train(drv)
5. class
6. manufacturer

```
library(dplyr)
```

```
##
## Attaching package: 'dplyr'
## The following objects are masked from 'package:stats':
##
##      filter, lag
## The following objects are masked from 'package:base':
##
##      intersect, setdiff, setequal, union
```

```
data(mpg)
```

```
## Warning in data(mpg): data set 'mpg' not found
```

```
categorical_columns <- data_mpg %>% select_if(is.factor) %>% colnames()
```

```
# Print the categorical columns
print(categorical_columns)
```

```
## character(0)
```

- c. Which are continuous variables? 1.X 2.engine displacement(displ) 3.year 4.cyl(number of cylinders) 5.city miles per gallon(cty) 6.highway miles per gallon(hwy)
2. Which manufacturer has the most models in this data set? Which model has the most variations? Show your answer. Ans. The manufacturer with the most model is: dodge The model with the most variations is: caravan 2wd

```
manufacturer_table <- table(data_mpg$manufacturer)
```

```
#getting the most model
```

```
maxModel_Manufacturer <- as.character(names(manufacturer_table)[which.max(manufacturer_table)])
```

```
cat("The manufacturer with the most model is: ",maxModel_Manufacturer,"\n")
```

```
## The manufacturer with the most model is:  dodge
```

```
model_table <- table(data_mpg$model)
maxVariation_Model <- as.character(names(model_table))[which.max(model_table)]

cat("The model with the most variations is: ",maxVariation_Model)
```

The model with the most variations is: caravan 2wd

2a. Group the manufacturers and find the unique models. Show your codes and result.

```
library(dplyr)
models <- data.frame(Manufacturer = data_mpg$manufacturer,
                      Model = data_mpg$model)

2. Same dataset will be used. You are going to show the relationship of the model and the manufacturer.
- 2a. What does `ggplot(mpg, aes(model, manufacturer)) + geom_point()` show? ans. With the model on the x-axis of the chart and the manufacturer on the y-axis, it generates a scatterplot for the mpg dataset.

```
library(ggplot2)

ggplot(data_mpg,
       aes(model, manufacturer)) +
  geom_point() +
  theme(plot.title = element_text(hjust = 0.5),
        axis.text.x = element_text(angle = 45, hjust = 1))
```

2b. For you, is it useful? If not, how could you modify the data to make it more informative? ans. Yes. It's very useful to know how many models each manufacturer produces. To make it more interesting, I can put color codes on each point based on the classes variable.

3. Plot the model and the year using ggplot(). Use only the top 20 observations. Write the codes and its results

```
data_mpg_20 <- head(data_mpg,20)
data_mpg_20
```

relationship between number of cylinders and engine displacement

5a. How would you describe its relationship? Show the codes and its result. Ans. When the number of cylinder increases the displacement also increases.

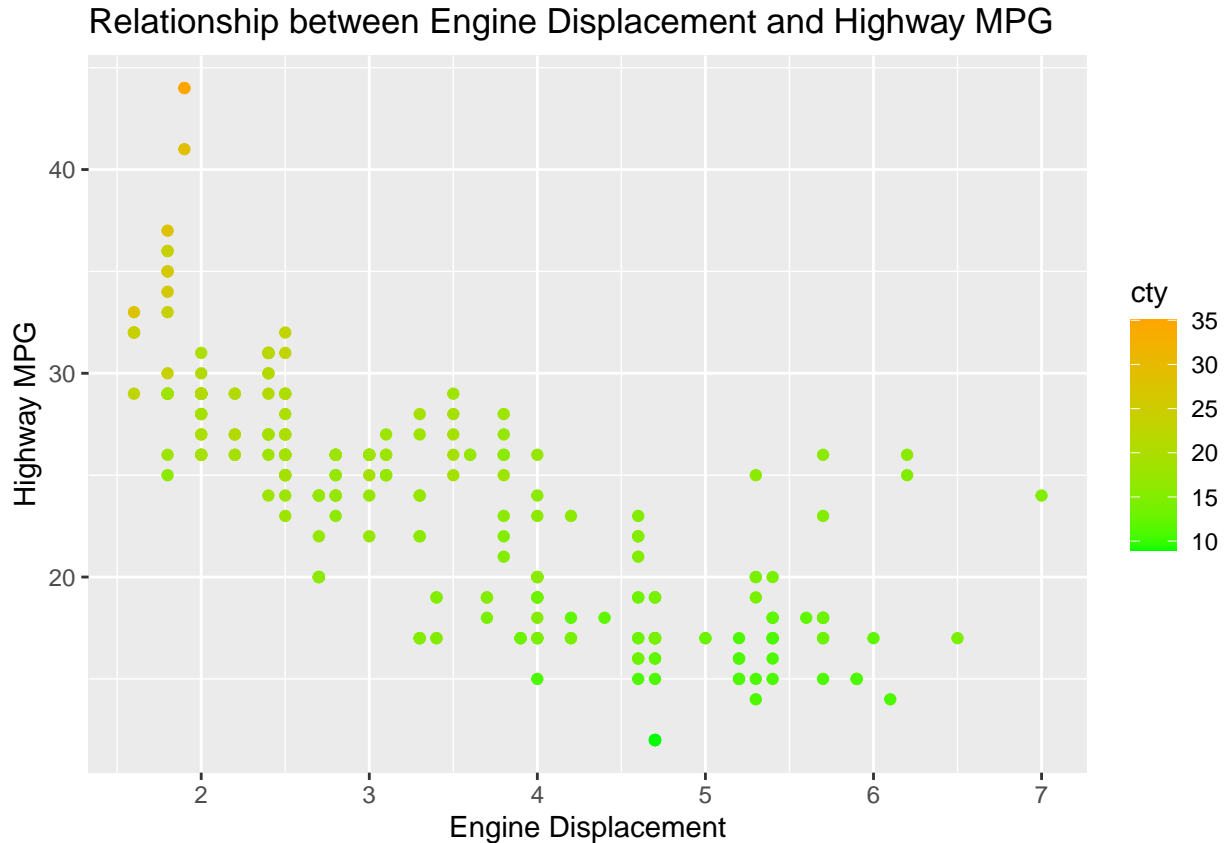

6. Plot the relationship between displ (engine displacement) and hwy (highway miles per gallon). Mapped it with a continuous variable you have identified in #1-c. What is its result? Why it produced such output?

ans. Based on a color mapping to the city miles per gallon (cty), this output allows us to visually analyze the relationship between various city fuel economy levels and engine displacement (displ), as well as the highway miles per gallon (hwy), which helps us understand how fuel-efficient vehicles with various engine sizes are.

```
